

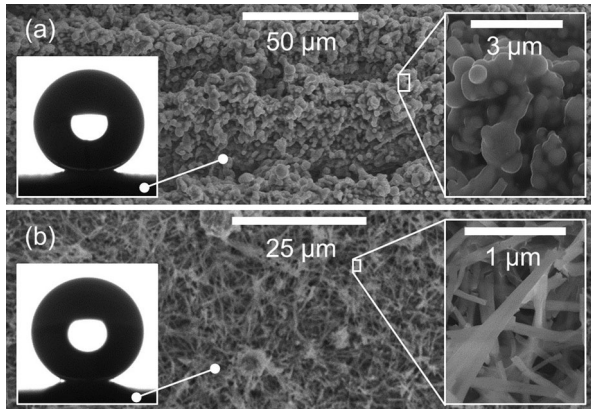

FIG. 1. Scanning electron microscope (SEM) images of (a) the laser-etched microstructured copper surface (300 $\times$; top-right inset at 4000 $\times$) and (b) the chemically etched nanostructured copper surface (800 $\times$; top-right inset at 15 000 $\times$). Insets at bottom left of each frame show a static 5 μl droplet resting on the respective surface in the Cassie-Baxter state.
