

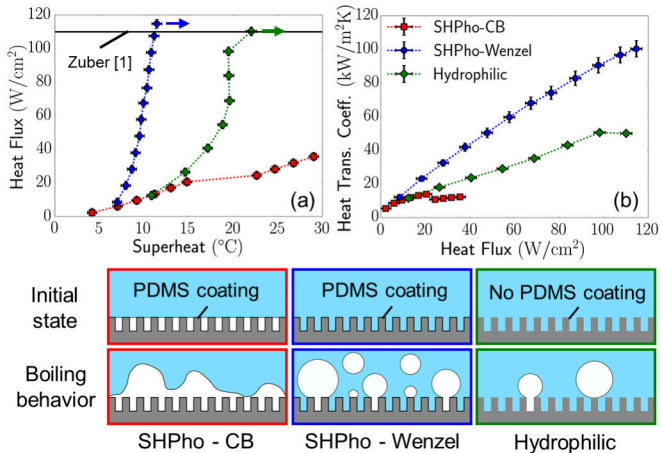

FIG. 4. (a) Boiling curves (surface heat flux as a function of superheat) and the associated (b) heat transfer coefficients for the three microstructured surface cases: superhydrophobic in the Cassie-Baxter state (SHPho-CB), superhydrophobic in the Wenzel state (SHPho-Wenzel), and bare copper (Hydrophilic). Illustrations below the graphs indicate the relationship between the initial wetting state and the boiling behavior. High-speed visualizations are provided in Video S4 of the Supplemental Material [32].
