

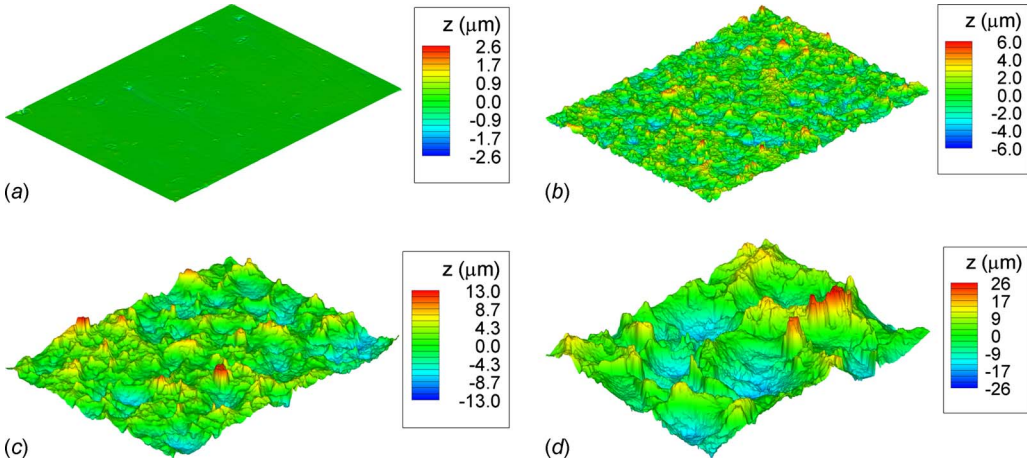

Fig. 2 Surface topography of test surfaces over an area of $400 \times 300 \mu\text{m}^2$ as measured by an optical profilometer: (a) 0.038 μm polished surface, (b) 1.08 μm EDM surface, (c) 2.22 μm EDM surface, and (d) 5.89 μm EDM surface

3 Experimental Results

EDM surface achieved the highest heat transfer coefficient for a given heat flux while the polished test piece resulted
