

particle size for more liquid, mixtures of different sizes of 3 mm and 6 mm particles. The boiling heat transfer coefficient increases over a heat flux range

Acknowledgements

Funding for this work was provided by the Center, an NSF IUCRC. The author acknowledges the significant assistance of the staff in the preparation of this manuscript.

Appendix A. Effects of

Effects of the number of particles on the heat transfer enhancement were investigated here using spherical particles. The heat transfer coefficient can be approximately 0.9

Fig. 8. Boiling heat transfer coefficients as a function of input heat flux for 3 mm and 6 mm free particles.
