

(a)

400 μm strip, 50,000 W/m^2
estimated boiling curve on ITO heater
natural convection on glass top, $T_\infty=329\text{ K}$
1.4 $\text{W}/\text{m}^2\text{K}$ convection on glass bottom, $T_\infty=310\text{ K}$

**(b)**

Fig. 7. Results of heat spreading simulations under simplified assumptions: (a) temperature contours for the 400- μm heater strip at $q_{\text{app}} = 50,000\text{ W}/\text{m}^2$; and (b) estimated effects of heater size and heat flux on the ratio of heat loss by spreading to total heat input.
