

Fig. 8. Interrogation windows were selected over multiple length scales for calculation of average R_a and R_q surface roughness parameters (only the portion of the surface between $x = 23$ mm and $x = 25$ mm is shown for clarity of illustration).

$$\text{or } h_{\text{new}} = h_{\text{old}} \left[\Delta T_{w,\text{calc}} - \omega \cdot \frac{\Delta T_{w,\text{exp}} - \Delta T_{w,\text{calc}}}{\Delta T_{w,\text{exp}} \cdot \Delta T_{w,\text{calc}}} \right]. \quad (7)$$

25 mm $\times$ 400 μm were obtained with a Zygo Newview 6200 white-light optical interferometer at 50 $\times$ magnification. A white-light interferometer can only resolve very steep asperity angles at
